

A Multimedia Computer-Based Intervention for College Student Drinking: Short-Term Outcomes of a Randomized Trial

Thad R. Leffingwell

Caleb W. Lack
Oklahoma State University

Feedback Based Interventions

- Interventions including substantial feedback-based components are the most promising evidence-based approach for reducing high-risk drinking among college students (Walters & Neighbors, 2005; Larimer & Cronce, 2002).
- Feedback both with and without in-person motivational interviewing style interaction produce comparable short-term outcomes (Walters & Neighbors, 2005).
- Additional value of interviewer or group didactics to feedback interventions is unclear.

Problem: Dissemination

- ⇒ A number of practical barriers limit the wider dissemination of feedback-based interventions:

For feedback alone:

- Selection of appropriate measures
- Scoring and interpreting the measures
- Producing meaningful feedback

For in-person feedback:

- *Requires staff*
- *Training and Supervision*
- *Adherence to MI principles and strategies*

For both:

- *Lack of instantaneous feedback requires multiple contacts, risking attrition*

Possible Solution: Electronic Formats

- ⇒ Perhaps the effective ingredients of feedback-based interventions can be captured in electronic formats and delivered via web, compact disk or email
- ⇒ Advantages of easy dissemination to targeted population and perfect fidelity to ideal treatment strategies
- ⇒ Others have developed and tested electronic adaptations:
 - e-CHUG and e-TOKE (Walters, Van Sickle, and Moyer)
 - www.mystudentbody.com (alcohol) (Chiauzzi et al., 2005)
 - e-SBI (Bendtsen, Johannson, & Åkerlind, in press)
 - Drinker's Check-up (Hester, Squires, & Delaney, 2005)

College Drinker's Check-up

- ⇒ Multimedia assessment and feedback tool for high-risk drinkers
- ⇒ Self-guided and self-paced
- ⇒ Video “interviewer” walks the participant through the program giving instructions, offering encouragement, offering interpretive information about the feedback, and asking open-ended questions to elicit processing
- ⇒ Administered via local computer, either hard drive or compact disc (cd), not over the internet
- ⇒ Takes 30-40 minutes to complete

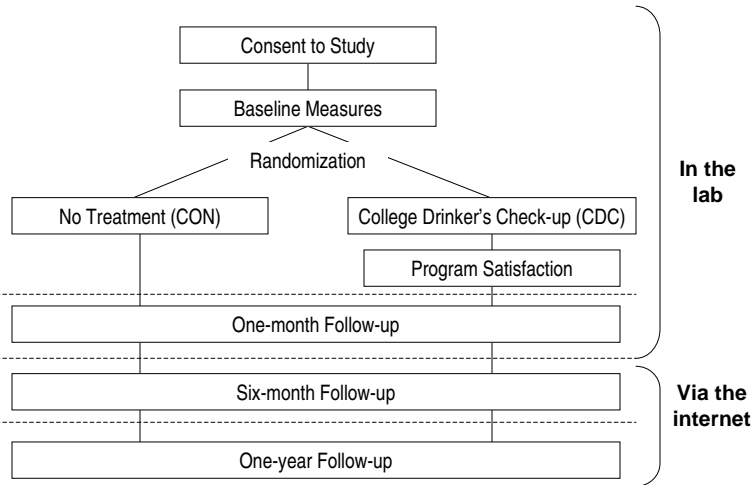

College Drinker's Check-up (continued)

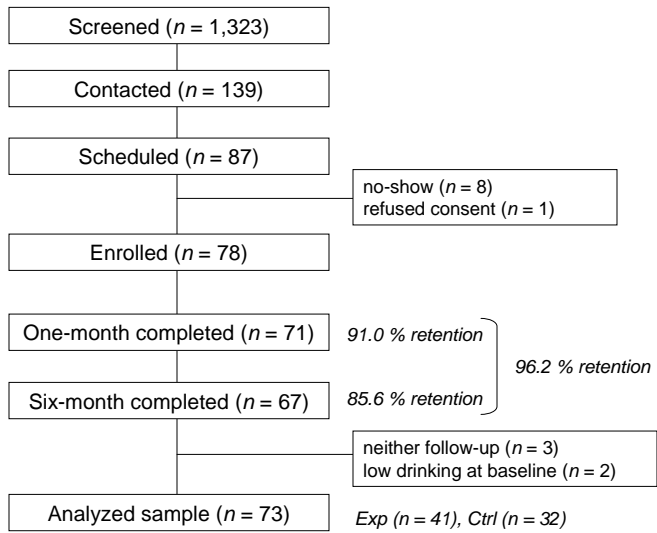

Measure	Feedback Domain
Form-90	Peak and Typical Blood Alcohol Concentrations (BAC); <i>costs of use (both financial and caloric)</i>
RAPI	<i>Alcohol-related life problems</i>
AUDIT & MAST	<i>Likelihood of Presence of Alcohol Use Disorder and Diagnostic Criteria</i>
Drinking Norms Scale	<i>Norms Challenge</i>
Brief Situational Confidence Questionnaire	<i>Confidence at avoiding heavy alcohol use in a number of contexts</i>
Behavioral Health Screener	<i>Likelihood of presence of behavioral or emotional problems possibly related to alcohol use</i>

Study Design

Participant Flow

Measures

Baseline Only:

- ⇒ Demographics
- ⇒ AUDIT (Saunders et al., 1993)
- ⇒ Self-Monitoring Scale (Attention to Social Comparison Subscale) (Lennox & Wolfe, 1984)
- ⇒ California Psychological Inventory (Socialization Subscale) (Gough, 1994)

Baseline and All Follow-ups:

- ⇒ Daily Drinking Questionnaire (Collins, Parks & Marlatt, 1985)
- ⇒ Frequency-Quantity Questionnaire (modified) (Cahalan & Cisin, 1968)
- ⇒ CAPS-r (Maddock, Laforge, Rossi, & O'Hare, 2001)
- ⇒ SOCRATES (Miller & Tonigan, 1996)
- ⇒ Other Drugs (past 6 months) (Collins, Parks & Marlatt, 1985)
- ⇒ Worry about Drinking (McCaul & Mullens, 2003)

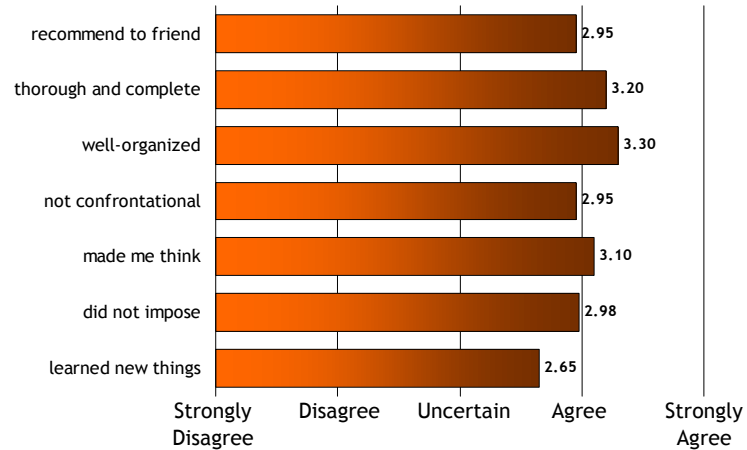

Sample Characteristics

- ⇒ Both men ($n=62$) and women ($n=16$)
- ⇒ Average age 19.9 (range 18 to 24)
- ⇒ Mostly white, non-hispanic (89.6%)
- ⇒ Used an average of 1.6 other drugs, marijuana most popular (55.1%)
- ⇒ Average AUDIT score of 14, all > 8
- ⇒ Average baseline Total Drinks per Week (DPW) = 31.5 ($SD = 12.8$)
- ⇒ Average Drinks per Peak Drinking Occasion = 14.68 ($SD = 3.6$)
- ⇒ Average Drinks per Typical Occasion = 12.5 ($SD = 4.5$)
- ⇒ CAPS-r Total = 8.0 ($SD = 4.8$)
- ⇒ SOCRATES - Ambivalence = 9.3 ($SD = 3.64$)
- ⇒ Worry - Total = 2.8 ($SD = 2.41$)

Program Satisfaction

Results

- ⇒ Randomization check
 - Only one significant difference between groups at baseline, CDC group reported more days “drinking to get drunk” than control group (11.07 vs. 8.12, $F(1,71)=4.94$, $p < .03$)
- ⇒ Mixed-model ANOVA
 - Time x treatment interaction

Results (cont.)

Time $F(2,142) = .44, p = .65, \eta^2 = .01$
 Time x Treatment $F(2,142) = .31, p = .74, \eta^2 = .004$

Results (cont.)

Time $F(2,142) = 4.45, p = .01, \eta^2 = .06$
 Time x Treatment $F(2,142) = 2.12, p = .12, \eta^2 = .03$

Participant Responses during Feedback

Conclusions and Future Plans

- Program was generally well-liked by participants
- Instantaneous feedback reduces assessment-feedback attrition to zero
- High-risk sample and little attrition to follow-up
- Program failed to produce changes in drinking behavior comparable to other feedback-based brief interventions
- Interactive features of feedback may have amplified resistance rather than encouraged more thorough processing
- Software has been modified to remove requests for responses to feedback, trial underway
